Overview

ASSET’s ScanWorks® FPGA-based Fast Programming (FFP) product performs fast programming of Serial Peripheral Interface (SPI), NOR/NAND flash, and Inter-Integrated Circuit (I2C) devices by use of customizable IP which it has inserted into an FPGA on the target board. The benefit of using customizable IP instead of programming these via the Boundary Scan chain is that it significantly decreases programming times. Examples of the benefits of utilizing ASSET’s FFP solution are provided below (Figure 1).

**Key Benefits:**
- IP provides significant reduction in programming time
- Utilizes an existing on-board FPGA as an Embedded Programmer
- Customizable IP and easy target FPGA selection
- FFP supports an array of FPGA’s from Xilinx, Intel (Altera) and MicroChip (Microsemi)

**Key Product Features:**
- Integrated with ScanWorks only needs licensing to existing ScanWorks Test Development or Manufacturing Licenses
- Easy integration with ScanWorks API
- SVF or STP for FPGA configuration with ScanWorks
- Adds another non-intrusive test technology to the ScanWorks Platform
- FPGAs Supported Xilinx, Intel (Altera), Microchip (Microsemi)

* Customer Stopped BST Programming. Three hour completion time was used for improvement calculation.

The FFP product includes the Embedded Tester Generator application, configuration and programming actions, device programming IP library, and FPGA model library. This combination makes development easy and seamless.

**Embedded Tester Generator**

Target FPGA, IP selection, customization, and synthesis are all accomplished through the use of ScanWorks Embedded Tester Generator® (ETG) application (Figure 2). Once licensed, the settings must point to your company’s existing
synthesis tool environment. Target FPGA selection is performed by using a simple pick list of FPGA’s based on families and part numbers. IP selection is also performed in a similar manner. Once the target FPGA and IP have been selected, customization based on pin connections between the target FPGA and the target device can be entered. Bit file synthesis is achieved with the push of button. Once synthesis is complete, a Serial Vector Format (SVF) or STAPL file is created and used for IP insertion into the target FPGA via a ScanWorks SVF action. Once the IP is inserted into the FPGA, a programming action can be created (Figure 3).

Available FFP IP Instruments

**SPI Flash IP** – The SPI Flash IP is an easy to use instrument providing at-speed programming of devices based on the Serial Peripheral Interface (SPI) Bus protocol in a board test FPGA environment. More detailed information on the SPI Flash IP is contained in the SPI Flash IP Fact Sheet.

**BST_IO** – The BST_IO IP is an easy to use instrument that reduces the size of the Boundary-Scan Register within an FPGA, thus shortening the overall board Scan Chain. The BST_IO IP is used to significantly reduce erase, programming, and verify times of NOR/NAND, SPI, and I2C memory as compared to the same operations using the FPGA’s entire boundary register. More detailed information on the BST_IO IP is contained in the BST_IO Fact Sheet.

**ScanWorks Platform for Embedded Instruments**

ScanWorks Platform for Embedded Instruments is a seamless software environment to access, run and collect data from any instrument in your chips, circuit boards or systems. The ScanWorks Platform includes products for Boundary-Scan Test (BST), Processor-Controlled Test (PCT), FPGA-based Fast Programming (FFP), FPGA-Controlled Test (FCT) and IJTAG test.
